Planetary Communications

The majority of Planetary Communications is done via a series of fiber-optic wire and satellite that spans the entire globe. This allows for instant communication across the planet no matter how remote. Most communications that are hard-wired to buildings or communications booths are done with a visual communications system that allows for people to talk face-to-face even with distance.

Mobile Communications Systems on Abwehr share similar qualities with other nations. Small devices that reach the size of a small childs fist called 'MOBCOMS' (short for Mobile Communication Systems) are owned by practically everyone. Each one is affordable and is able to connect to the World Network easily. Standard functions other than voice communication include a camera function, calender/planner, text messenger system, and homing beacon for emergencies.
