

Tyo'te Wuny'ta (Fire Suppression)

The Tyo'te Wuny'ta (To contain Fire) system used by the [Poku Saeruo Degonjo](#) has been upgraded over the years. The current design came into use in 744 CY ([YE 27](#)).

The [clan](#) ships and facilities use the same system. The system has several methods to combat the fire.

First it discharges Tyo'te Pasoute Niufqor (Fire Killing Gas) that binds with the oxygen in the atmosphere. If the temperature in the area does not respond sufficiently, an additional release is made. When the system is activated personnel in the area must don walkabout oxygen bottles, or leave the vicinity.

If after the second discharge the fire does not extinguish by the Tyo'te Pasoute Niufqor (Fire Killing Gas), then conventional hand operated extinguishers must be used, or the system will seal the compartment and vent atmosphere to vacuum.

Tyo'te Pasoute Niufqor (Fire Killing Gas)

The Tyo'te Pasoute Niufqor is the latest tool for fire suppression used by the [Poku Saeruo Degonjo](#), it came into use in 744 CY ([YE 27](#)).

It was developed by the [Otâmovi Wiy Jael \(Silver Moon Sect\)](#) to replace the prior gas. The gas is a colorless liquid with a boiling point of 47.2 °C. When sprayed it binds with the oxygen in the air to deprive the fire, in high enough concentrations it will smother the fire unless there is an additional source of oxygen.

Note: It is dangerous for an person to breath in large quantities of the vapor.
