Disturber Beacon

The Solan Starworks Disturber Beacon is a distress beacon system that emits low energy spatial ripples which can travel many times the speed of light, through real space. Based on advanced space compression technology, they emit long ranged low-penetration oscillations in space that do not posses enough energy to affect or even traverse any solid matter, but can adequately pass through vacuum and clouds of light gasses such as Hydrogen or Helium. However, large nebular clouds, planets and sufficiently dense debris fields will create sufficient interference and dampening to make this system ineffective in those areas.
